Town Supervisors  
Highway Superintendents and Public Works Commissioners  
Police Agencies  
Dutchess County Traffic Safety Board  
Dutchess County Department of Public Works

From: Mark DeBald, Transportation Program Administrator  
Dutchess County Transportation Council

Date: January 22, 2018

Subject: High-End Speeding Analysis for Dutchess County (2014-2017)

The Dutchess County Transportation Council (DCTC) recently completed its second analysis of speeding patterns on county and local roads, based on data collected from our annual traffic count program. The DCTC typically conducts 250 traffic counts annually, with individual locations counted every three years. Though the program originally focused on collecting traffic volume data, we now also collect vehicle speeds and classifications. In 2016, we conducted our first analysis of the speed data, using data from 2012-2015, to identify potential speeding issues on county and local roads. Based on the positive feedback from our first analysis, we have updated the analysis using data from 2014-2017.

The speeding analysis identifies road segments with high percentages of ‘high-end’ speeding, defined by staff as those traveling more than 10 mph over the posted speed limit. By highlighting road segments with high-end speeding, we hope to assist elected officials, law enforcement agencies, and highway departments with their efforts to target speed enforcement, implement traffic calming measures, and allocate resources to reduce speeding and improve traffic safety. This year we have added speed-related crash data to the analysis, to enable comparison of high-speed areas with reported crashes involving speed. Below is a summary of our findings:

a. Overview

- For this 2017 update, staff analyzed speed data collected from 1,042 unique road segments in Dutchess County during a four-year period (2014-2017). The speed data was collected through our annual traffic count program, which relies on automatic traffic recorders (pneumatic tubes placed across the road) placed for 3-7 days at designated locations.
- Thirteen percent of the measured road segments (114 segments total) had 85<sup>th</sup> percentile speeds (the speed that 85 percent of drivers travel at or below) more than 10 mph above the designated limit in at least one direction (e.g. eastbound or westbound). This represents an increase from the 2016 analysis (which found high-end speeding on nine percent of segments).

b. Jurisdiction

- About 56 percent of road segments with high-end speeding were located on County roads, while 44 percent were on local roads. This is similar to 2016 figures.
- Road segments with high-end speeding were located in 23 of our 30 municipalities. As in 2016, the Town of Poughkeepsie had the most segments with high-end speeding (26), followed this year by the Towns of Stanford (9), Wappinger (9), Dover (8), and Hyde Park (8).

c. High-End Speeding Extent

- Of the 114 road segments with high-end speeding, 81 percent (93 segments) had 85<sup>th</sup> percentile speeds between 10-15 mph over the speed limit, 10 percent (13 segments) had 85<sup>th</sup> percentile speeds between 15-17.5 mph over the speed limit, and six percent (eight segments) had 85<sup>th</sup> percentile speeds more than 17.5 mph over the speed limit. These percentages are similar to the 2016 analysis.
- Roads with 85<sup>th</sup> percentile speeds more than 17.5 mph over the speed limit included CR 26 (Dover Furnace Road) in Dover; CR 62 (Sharon Road) in North East; Bedell Road, CR 100 (Creek Road) and Zachs Way in the Town of Poughkeepsie; Whalesback Road in the Town of Red Hook; and CR 65 (Hunns Lake Road) and CR 17 (Salt Point Turnpike) in Stanford.

d. Directional Differences

- About 48 percent of the 114 road segments experienced high-end speeding in both directions (e.g. northbound and southbound), while 52 percent exhibited high-end speeding in only one direction (e.g. northbound only).
- About two thirds of the road segments (76 segments) had less than a three mph difference between the 85<sup>th</sup> percentile speeds of each direction. Twenty-three percent of the road segments (26 segments) had a 3-6 mph difference, and 11 percent (12 segments) had more than a 6 mph difference.
- There are various reasons for the larger speed differences. On some roads, like CR 66 (North Quaker Hill Road) it could be the result of geometries like a hill or curve. In other cases, it may be due to proximity to a higher-speed road, with motorists acclimated to higher speeds failing to slow down when they transition to the lower-speed road. Examples of the latter were CR 6 (Old Route 22) and CR 30 (Holmes Road). In other cases, it was not clear what caused the discrepancy.

e. Relationship between High-End Speeding Road Segments and Crashes

- The primary change to this year's report is the addition of speed-related crash information. The enclosed maps include crashes from 2012-2016 in which the responding officer noted "unsafe speed" as a contributing factor.
- We were interested to see the relationship between segments with high-end speeding and the location of speed-related crashes. Each segment's crash rate (based on the number of crashes, vehicle volume, and road segment length) is included in the table that follows each map. The rate represents the number of speed-related crashes per million vehicle miles traveled (VMT) on that road segment.<sup>i</sup> Rates vary from zero (on segments where there were no speed-related crashes during the study period) to 2.67, with an overall average of 0.37 crashes per million VMT. This compares with an average of 0.19 for a sample of local and county-owned roads in Dutchess County, providing evidence for a relationship between locations of high-end speeding and speed-related crashes.<sup>ii</sup>

- As shown on the maps, many road segments that are not identified as having high-end speeding do have clusters of speed-related crashes. This can be the result of road geometry (especially curves), of drivers adhering to the posted speed limit but still traveling too fast for conditions, or of a smaller percentage of high-end speeders than captured by the 85<sup>th</sup> percentile method.
- This exercise is limited by the size of the speed-related crashes dataset. If municipalities find this information valuable, staff can conduct a more robust analysis, incorporating more road segments and additional years of crash data.

For detailed information about your municipality or specific roads, please refer to the enclosed information, which includes a complete list of county and local road segments with high-end speeding, as well as maps and tables specific to each municipality with high-end speeding. There are no maps for municipalities without identified high-end speeding. Road segments that cross municipal borders will appear on each adjoining municipal table and map. Also, note that speed limits are based on our current database, and reflect the limit at the time the count was taken. Some speed limits may have changed in the interim, and others may be incorrect in the database.

If you have any questions or comments about the analysis, please contact me at (845) 486-3600 or by email at [mdebald@dutchessny.gov](mailto:mdebald@dutchessny.gov). Please let us know if you find this information useful or if you have updated speed limit data for your jurisdiction. Depending on interest, we will update the analysis in future years. Please note that the DCTC periodically conducts Safety Assessments at high-crash locations on local roads; if you wish us to research a specific location or have candidates for a possible Safety Assessment, please feel free to contact us.

Yours truly,

/signed/

Mr. Mark Debald

Transportation Program Administrator

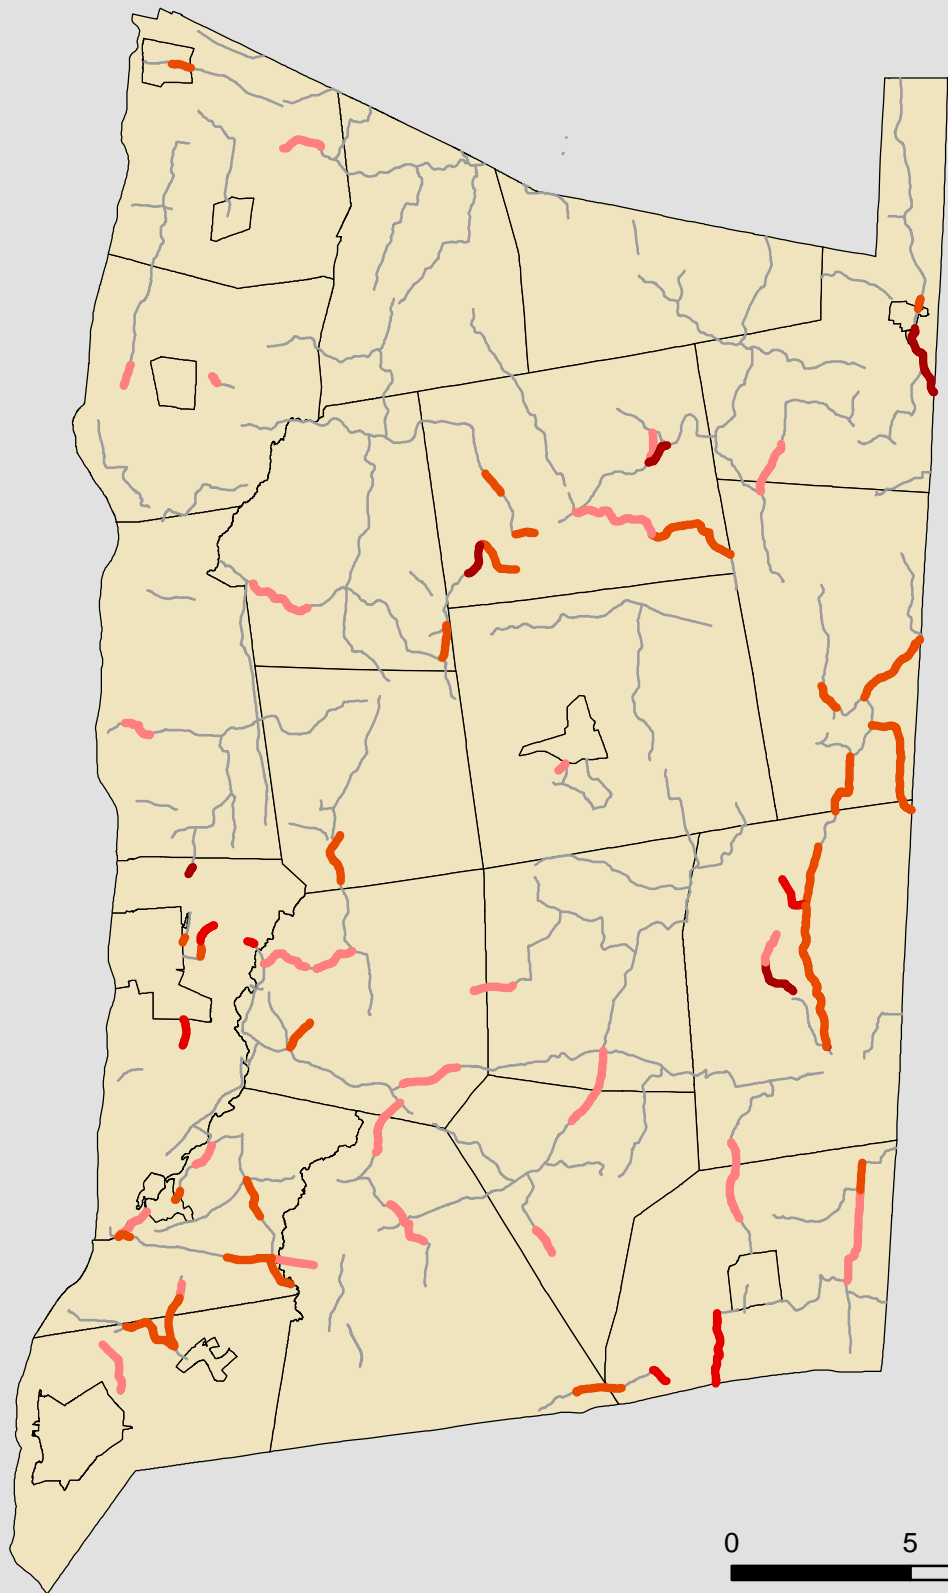

---

<sup>i</sup>To find VMT for each segment, we use the Annual Average Daily Traffic (AADT) generated by our traffic counts, multiplying it by 365 and then by the number of years in the study period (5) to estimate the total number of vehicles on the segment from 2012-2016. We then multiply that by the length of the roadway segment as calculated in our GIS database. The crash rate per million VMT is the number of crashes on the segment during those years multiplied by one million, then divided by the VMT.

<sup>ii</sup> The sample contains the 977 traffic count locations for which all the necessary data (speed, average daily traffic, and segment length) exists.
