

2020 High-End Speeding Report

An Annual Analysis of Speeding Patterns on Select
County and Local Roads

Disclaimer

The preparation of this report has been financed in part through grant[s] from the Federal Highway Administration and Federal Transit Administration, U.S. Department of Transportation, under the State Planning and Research Program, Section 505 [or Metropolitan Planning Program, Section 104(f)] of Title 23, U.S. Code. The contents of this report do not necessarily reflect the official views or policy of the U.S. Department of Transportation.

Title VI Statement

The Dutchess County Transportation Council (DCTC) is committed to compliance with Title VI of the Civil Rights Act of 1964, the Civil Rights Restoration Act of 1987, and all related rules and statutes. DCTC assures that no person or group(s) of persons shall, on the grounds of race, color, age, disability, national origin, gender, or income status, be excluded from participation in, be denied the benefits of, or be otherwise subjected to discrimination under all programs, services, or activities administered by the DCTC, whether those programs and activities are federally funded or not. It is also the policy of the DCTC to ensure that all its programs, polices, and other activities do not have disproportionate adverse effects on minority and low income populations. Additionally, the DCTC will provide meaningful access to services for persons with Limited English Proficiency.

2020 High-End Speeding Report

This report presents the Dutchess County Transportation Council's (DCTC's) annual analysis of speeding patterns on county and local roads, which is based on data collected from our traffic count program. The DCTC typically conducts about 250 traffic counts annually, with most locations counted every three years. Though the program originally collected only traffic volume data, we now also collect vehicle speeds and classifications. In 2016, we conducted our first analysis of the speed data to identify potential speeding issues on county and local roads. In subsequent versions, we have expanded the amount of data considered and added a speeding-related crash analysis.

This speeding analysis identifies road segments with high percentages of 'high-end' speeding, defined by staff as speeds more than 10 mph over the posted speed limit. By highlighting locations with high-end speeding, we hope to assist elected officials, law enforcement agencies, and highway departments with their efforts to target speed enforcement, implement traffic calming measures, and allocate resources to reduce speeding and improve traffic safety. Below is a summary of our findings:

Overview

- For this 2020 update, we analyzed speed data for 821 unique road segments in Dutchess County over a five-year period (2015-2019). The speed data was collected by automatic traffic recorders (pneumatic tubes placed across the road) placed for 3-7 days at designated locations.
- Sixteen percent of the road segments (135 segments

total) had 85th percentile speeds (the speed that 85 percent of drivers travel at or below) more than 10 mph above the designated limit in at least one direction (for example, eastbound or westbound on an east-west road). In other words, at least 15 percent of drivers were traveling more than 10 mph over the posted speed limit on these segments (similar to the 2019 analysis).

Jurisdiction

- About half (53 percent) of the segments with high-end speeding were on local roads, with the other 47 percent on county roads.
- Road segments with high-end speeding were found in 25 of 30 municipalities. As in previous years, the Town of Poughkeepsie had the most segments with high-end speeding (31), followed this year by the Towns of Wappinger (17), LaGrange (13), East Fishkill (10), and the City of Poughkeepsie (10). The five municipalities with no high-end speeding segments were the Town of Union Vale and the Villages of Millerton, Millbrook, Red Hook, and Rhinebeck.

Extent of High-End Speeding

- Of the 135 road segments with high-end speeding, 82 percent (111 segments) had 85th percentile speeds between 10-15 mph over the speed limit, 10 percent (13 segments) had 85th percentile speeds between 15-17.5 mph over the speed limit, and 8 percent (11 segments) had 85th percentile speeds more than 17.5 mph over.

Directional Differences

- Fifty percent of the 135 road segments experienced high-end speeding in both directions (e.g. northbound and southbound). The other 50 percent exhibited high-end speeding in only one direction (e.g. northbound only).
- About 60 percent of the road segments (83 segments) had less than a three-mph difference between the 85th percentile speeds of each direction. 28 percent of the road segments (38 segments) had a three to six mph difference, and 10 percent (14 segments) had more than a six-mph difference.
- There are various reasons for these speed differences. On some roads, like Smithfield Rd (CR 5) or Ketchamtown Rd, it may be the result of a hill or curve. In other cases, it might be due to its proximity to a higher-speed road, with drivers acclimated to higher speeds failing to slow down when they transition to the lower-speed road. For example, on Titusville Rd (CR 49), westbound traffic has recently exited the higher-speed Route 55. Directional volume differences can also have an effect. Carpenter Rd (CR 29), for example, only has access to the Taconic State Parkway's southbound lanes, leading to average daily southbound traffic of around 1,400 and northbound traffic of only 70. Outlier speeds have a greater impact on the lower-volume direction, in this case resulting in northbound speeds far lower than southbound speeds.

Relationship between High-End Speeding and Crashes

- The enclosed tables include an analysis of crashes from

the most recent five years for which data is currently available (2014-2018). This data comes from the New York State Accident Location Information System (ALIS). It is the best data available to us but does not include unreported crashes. We filtered the data to include only crashes in which the responding officer listed speed as a contributing factor. This does not include crashes in which speed may have played a role but was not one of the factors noted by the responding officer.

- The total number of crashes along each road segment and the segment's crash rate (based on the number of crashes, vehicle volume, and road segment length) is included in the table that follows each map. The rate represents the number of speed-related crashes per million vehicle miles traveled (VMT) on that road segment.¹ Rates vary from zero (on segments where there were no crashes during the study period) to 4.5, with an overall average of 0.4 crashes per million VMT. This matches the average rate for a broader sample of local and county-owned roads in Dutchess County, differing from previous reports, which showed a higher speed-related crash rate on high-end speeding roads.²
- It is important to note that on low-volume roads, one crash can cause a significant change in the crash rate. The total number of speed-related crashes should be considered in addition to the rate when determining the extent of any safety issue on a segment.
- Roads with substantial crash totals and rates included:

2020 High-End Speeding Report

- Overlook Rd (CR 46), between Degarmo Rd (CR 43) and Rombout Rd in the Town of LaGrange, experienced the most speeding-related crashes, with 43 crashes and a rate of 4.5.
- Robinson Ln between the Wappinger town line and Noxon Rd (CR 21) in the Town of LaGrange, with 14 crashes and a rate of 3.0.
- West Rd (CR 71) between Salt Point Turnpike (NY 115) and Route 44 in the Town of Pleasant Valley, with 20 crashes and a rate of 1.3.
- All Angels Hill Rd (CR 94) between Route 82 and Old Hopewell Rd (CR 28), with 15 crashes and a rate of 1.4.

Questions and Comments

For detailed information about a municipality or specific roads, please refer to the enclosed information, which includes a complete list of county and local road segments with high-end speeding, as well as maps and tables for each municipality containing a high-end speeding road segment. There are no maps for municipalities without identified high-end speeding. Road segments that cross municipal borders appear on the table and map for both municipalities. Note that speed limits are based on our current database and reflect the limit at the time the count was taken. Some speed limits may have changed in the interim, and others may be incorrect in the database.

If you have any questions or comments about the analysis, please contact us at dctc@dutchessny.gov. Previous analyses can be found on our website under the [Publications](#) page.

¹To find VMT for each segment, we use the Annual Average Daily Traffic (AADT) generated by our traffic counts and multiply it by 365 and then by the number of years in the study period (5) to estimate the total number of vehicles on the segment from 2014-2018. We then multiply that by the length of the roadway segment as calculated in our GIS database. The crash rate per million VMT is the number of crashes on the segment during those years multiplied by one million, then divided by the VMT.

² The broader sample contains the 822 traffic count locations for which the necessary data (average daily traffic and segment length) exists.
