Dutchess County Transportation Council

Date: January 22, 2019

Subject: High-End Speeding Analysis for Dutchess County (2014-2018)

The Dutchess County Transportation Council (DCTC) recently completed its third annual analysis of speeding patterns on county and local roads, based on data collected from our annual traffic count program. The DCTC typically conducts about 250 traffic counts annually, with most locations counted every three years. Though the program originally focused on collecting traffic volume data, we now also collect vehicle speeds and classifications. In 2016, we conducted our first analysis of the speed data to identify potential speeding issues on county and local roads. In subsequent versions, we have expanded the number of years of data we consider and added information about speed-related crashes.

The speeding analysis identifies road segments with high percentages of 'high-end' speeding, defined by staff as speeds more than 10 mph over the posted speed limit. By highlighting road segments with high-end speeding, we hope to assist elected officials, law enforcement agencies, and highway departments with their efforts to target speed enforcement, implement traffic calming measures, and allocate resources to reduce speeding and improve traffic safety. Below is a summary of our findings:

a. Overview

- For this 2018 update, we analyzed speed data collected on 865 unique road segments in Dutchess County over a five-year period (2014-2018). The speed data was collected through our annual traffic count program, which relies on automatic traffic recorders (pneumatic tubes placed across the road) placed for 3-7 days at designated locations.
- Sixteen percent of the measured road segments (136 segments total) had 85<sup>th</sup> percentile speeds (the speed that 85 percent of drivers travel at or below) more than 10 mph above the designated limit in at least one direction (for example, eastbound or westbound on an east-west road). In other words, on these road segments at least 15 percent of drivers were traveling more than 10 mph over the posted speed limit.

b. Jurisdiction

- About half (48 percent) of the segments with high-end speeding were on county roads, with the other 52 percent on local roads. This is similar to our previous analyses.
- Road segments with high-end speeding were located in 27 of our 30 municipalities. As in previous years, the Town of Poughkeepsie had the most segments with high-end speeding (28), followed this year by the Towns of Wappinger (15), Stanford (8), Hyde Park (8), and LaGrange (8). The three municipalities without any high-end speeding segments were the Villages of Millerton, Red Hook, and Rhinebeck.

c. Extent of High-End Speeding

- Of the 136 road segments with high-end speeding, 82 percent (111 segments) had 85<sup>th</sup> percentile speeds between 10-15 mph over the speed limit, 8 percent (11 segments) had 85<sup>th</sup> percentile speeds between 15-17.5 mph over the speed limit, and 10 percent (14 segments) had 85<sup>th</sup> percentile speeds more than 17.5 mph over the speed limit.
- Two road segments had 85<sup>th</sup> percentile speeds more than 20 mph over the speed limit: Hibernia Road from CR 13 (Clinton Corners Road) to Route 82 in Washington, and CR 100 (Creek Road) from Cottage Road to Cream Street in the Town of Poughkeepsie.

d. Directional Differences

- About 45 percent of the 136 road segments experienced high-end speeding in both directions (e.g. northbound and southbound), while 55 percent exhibited high-end speeding in only one direction (e.g. northbound only).
- About 60 percent of the road segments (81 segments) had less than a three-mph difference between the 85<sup>th</sup> percentile speeds of each direction. 28 percent of the road segments (38 segments) had a three-six mph difference, and 12 percent (17 segments) had more than a six-mph difference.
- There are various reasons for the larger speed differences. On some roads, like CR 5 (Smithfield Road) or CR 30 (Holmes Road), it could be the result of geometries like a hill or curve. In other cases, it may be due to proximity to a higher-speed road, with drivers acclimated to higher speeds failing to slow down when they transition to the lower-speed road. An example of this is CR 6 (Old Route 22), where southbound traffic has recently exited the higher-speed Route 22. Directional volume differences can also have an effect. CR 29 (Carpenter Road), for example, only has access to the Taconic State Parkway's southbound lanes, leading to average daily southbound traffic of around 1,400 and northbound traffic of only 70. Outlier speeds have a greater impact on the lower-volume direction, in this case resulting in northbound speeds far lower than southbound speeds.

e. Relationship between High-End Speeding Segments and Crashes

- The enclosed maps include crashes from the most recent five years for which data is currently available (July 2013-July 2018) in which the responding officer noted "unsafe speed" as a contributing factor. This data comes from the New York State Accident Location Information System (ALIS). It is the best data available to us but does not include unreported crashes. Our filtered dataset of crashes in which the responding officer listed speed as a contributing factor

also eliminates those in which speed may have played a role but was not one of the two factors noted by the responding officer.

- The total number of crashes along each road segment and the segment's crash rate (based on the number of crashes, vehicle volume, and road segment length) is included in the table that follows each map. The rate represents the number of speed-related crashes per million vehicle miles traveled (VMT) on that road segment.<sup>i</sup> Rates vary from zero (on segments where there were no speed-related crashes during the study period) to 3.04, with an overall average of 0.53 crashes per million VMT. This compares with an average of 0.17 for a broader sample of local and county-owned roads in Dutchess County, providing evidence for a relationship between locations of high-end speeding and speed-related crashes.<sup>ii</sup>
- It is important to note that on low-volume roads, one crash can cause a significant change in the crash rate. The total number of speed-related crashes should be considered in addition to the rate when determining the extent of the safety issue posed by speeding.
- Roads with substantial speeding-related crash totals and rates include:
  - CR 46 (Overlook Road) in LaGrange, with 31 crashes and a rate of 3.04. Most crashes are concentrated around two curves between Birch Hill Drive and Rombout Road, and many occurred during wet or icy conditions.
  - CR 94 (All Angels Hill Road) between CR 28 (Old Hopewell Road) and Route 82 in Wappinger, with 13 crashes and a rate of 1.25. Most of these crashes occurred either near the intersection with CR 28 or along the curve near Dugan Lane.
  - CR 14 (Hollow Road) between Fiddlers Bridge Road and Sodom Road, in Clinton, with eight crashes and a rate of 1.93. Three of these occurred at the intersection with Sodom Road.
  - CR 34 (Baxtertown Road) between Chelsea Road and CR 35 (Osborne Hill Road) in Fishkill, with 12 crashes and a rate of 1.3. Nearly all crashes occurred at one of three large curves along this segment.
- As shown on the maps, many road segments that are not identified as having high-end speeding do have clusters of speed-related crashes. This can be the result of road geometry (especially curves), of drivers adhering to the posted speed limit but still traveling too fast for conditions, or of a smaller percentage of high-end speeders than captured by the 85<sup>th</sup> percentile method.

For detailed information about your municipality or specific roads, please refer to the enclosed information, which includes a complete list of county and local road segments with high-end speeding, as well as maps and tables specific to each municipality containing a high-end speeding road segment. There are no maps for municipalities without identified high-end speeding. Road segments that cross municipal borders will appear on each adjoining municipal table and map. Also, note that speed limits are based on our current database, and reflect the limit at the time the count was taken. Some speed limits may have changed in the interim, and others may be incorrect in the database.

If you have any questions or comments about the analysis, please contact me or Dylan Tuttle at (845) 486-3600 or by email at [mdebald@dutchessny.gov](mailto:mdebald@dutchessny.gov) or [dtuttle@dutchessny.gov](mailto:dtuttle@dutchessny.gov). Please let us know if you find this information useful or if you have updated speed limit data for your jurisdiction. Also, if you wish to have us research a specific location in more depth or have

candidates for a possible Safety Assessment, please feel free to contact us.

---

<sup>i</sup>To find VMT for each segment, we use the Annual Average Daily Traffic (AADT) generated by our traffic counts and multiply it by 365 and then by the number of years in the study period (5) to estimate the total number of vehicles on the segment from 2014-2018. We then multiply that by the length of the roadway segment as calculated in our GIS database. The crash rate per million VMT is the number of crashes on the segment during those years multiplied by one million, then divided by the VMT.

<sup>ii</sup> The broader sample contains the 1,064 traffic count locations for which the necessary data (average daily traffic and segment length) exists.
